1. Initial Prompt

“Create a one-page personal portfolio website. Include sections: Home, About Me, Skills, Projects, and Contact. Use a clean modern design with pastel spring colors”

2. Refinement Prompts (at least 2 more)

Prompt 1: “Improve the website by adding a navigation bar with smooth scrolling. Improve spacing, typography, and layout structure. Make the design more modern, clean, and visually balanced.”

Prompt 2: “Improve the portfolio website by adding an image upload or photo section. Allow me to upload profile photos and project images that will display in the website. Add image placeholders for: profile picture, project gallery, and about section image. Make sure the layout is responsive and images are properly sized and aligned. Improve visual design with hover effects on images and a modern UI style.”

Final Prompt: Improve the website by polishing the overall design and user experience. Ensure consistent spacing, alignment, and typography across all sections. Add smooth scrolling animations, better section transitions, and subtle hover effects on buttons and project images. Make sure the layout is fully responsive on mobile and desktop. Improve the About Me section and portfolio gallery so they look clean, professional, and visually balanced. Ensure the image

upload/display system works properly and all images are neatly arranged in a modern grid layout

3. Screenshots of Outputs and Website link

4. Final Reflection:

The process of developing a one-page portfolio website using Replit AI demonstrated how iterative prompt engineering improves both structure and functionality of generated code. The initial prompt produced a basic website layout with standard sections such as Home, About Me, Skills, Projects, and Contact. However, the first output lacked visual refinement, interactive elements, and media integration, making it functional but visually simple.

The first refinement prompt improved the design by adding a navigation bar and enhancing spacing and typography. This made the website more organized and easier to navigate. The layout became more structured, and readability improved significantly. However, the design still lacked dynamic features and multimedia content.

The second refinement prompt introduced a major improvement by requesting image upload functionality and photo sections. This allowed the website to support profile images, project galleries, and about section visuals. The inclusion of images made the

website more engaging and realistic as a portfolio. Additional features, such as hover effects and responsive design further enhanced the user experience by improving interactivity and adaptability across devices.

Through this process, I observed that the quality of the output improved significantly with each refined prompt. The initial vague prompt produced a basic structure, while more detailed prompts led to increasingly complex and visually appealing results. The addition of image-related instructions had the biggest impact because it transformed the website from a text-based layout into a visual portfolio.

This activity helped me understand that prompt engineering is an iterative process where clarity, specificity, and progressive improvement are essential. Adding instructions such as image handling, responsiveness, and interactivity directly influenced the final output quality. I learned that effective prompting requires not only describing what to build but also how it should behave and appear.
